Executive Summary

SARO (Smart AI Risk Orchestrator) is an AI risk auditing platform providing evidence-based risk scoring and audit trail generation. This document is SARO's self-assessment against the NIST AI RMF 1.0. It does not constitute external certification.

GOVERN 1.1 - Policies and Procedures

SARO operates under the SARO Compliance Claims Matrix (v8.0.0), defining what SARO does and does not claim. All audit outputs carry mandatory disclaimers per AIGP human-in-the-loop requirements.

GOVERN 4.2 - Privacy Risk Management

SARO never stores raw prompt text beyond the audit session. PII detected during Gate 3 is flagged but not persisted in retrievable form. TRACE records store only anonymised signal metadata.

MAP 1.1 - Context Establishment

SARO's 4-gate pipeline is scoped to risk scoring and evidence generation only. It does not make deployment decisions, write to client systems, or certify AI systems.

MAP 2.3 - Fairness Scientific Findings

Gate 2 applies statistical parity difference analysis across demographic groups. Thresholds: 0.10 (warn), 0.20 (fail) per NIST MAP 2.3 guidance. Versioned rule pack nist-ai-rmf@1.0.0 implements this with CI-tested known-positive and known-negative fixtures.

MEASURE 2.5 - Robustness and Reliability

SARO implements Bayesian risk scoring (Beta-Binomial posterior, 95% credible intervals), MIT taxonomy keyword+regex detection across 7 risk domains, and TF-IDF cosine similarity against historical AI incidents. Rule nist-ai-rmf@1.0.0 maps Misinformation to MEASURE 2.5.

MEASURE 2.6 - TEVV Cycles

The SARO CI pipeline runs known-positive and known-negative fixture tests for every rule pack rule on every deployment - automated TEVV per NIST MEASURE 2.6.

MANAGE 4.1 - Residual Risk Treatment

SARO outputs residual risk scores and remediation guidance per MIT domain. Human operators must review and sign off via the TRACE Remedy workflow. SARO does not auto-remediate or modify client AI systems.

This document is audit evidence generated by SARO v8.0.0. It does not constitute regulatory certification, legal advice, or compliance approval. Human review and sign-off by qualified personnel is required before any regulatory submission.
